

X-dimensional Mass Spectrometry Imaging

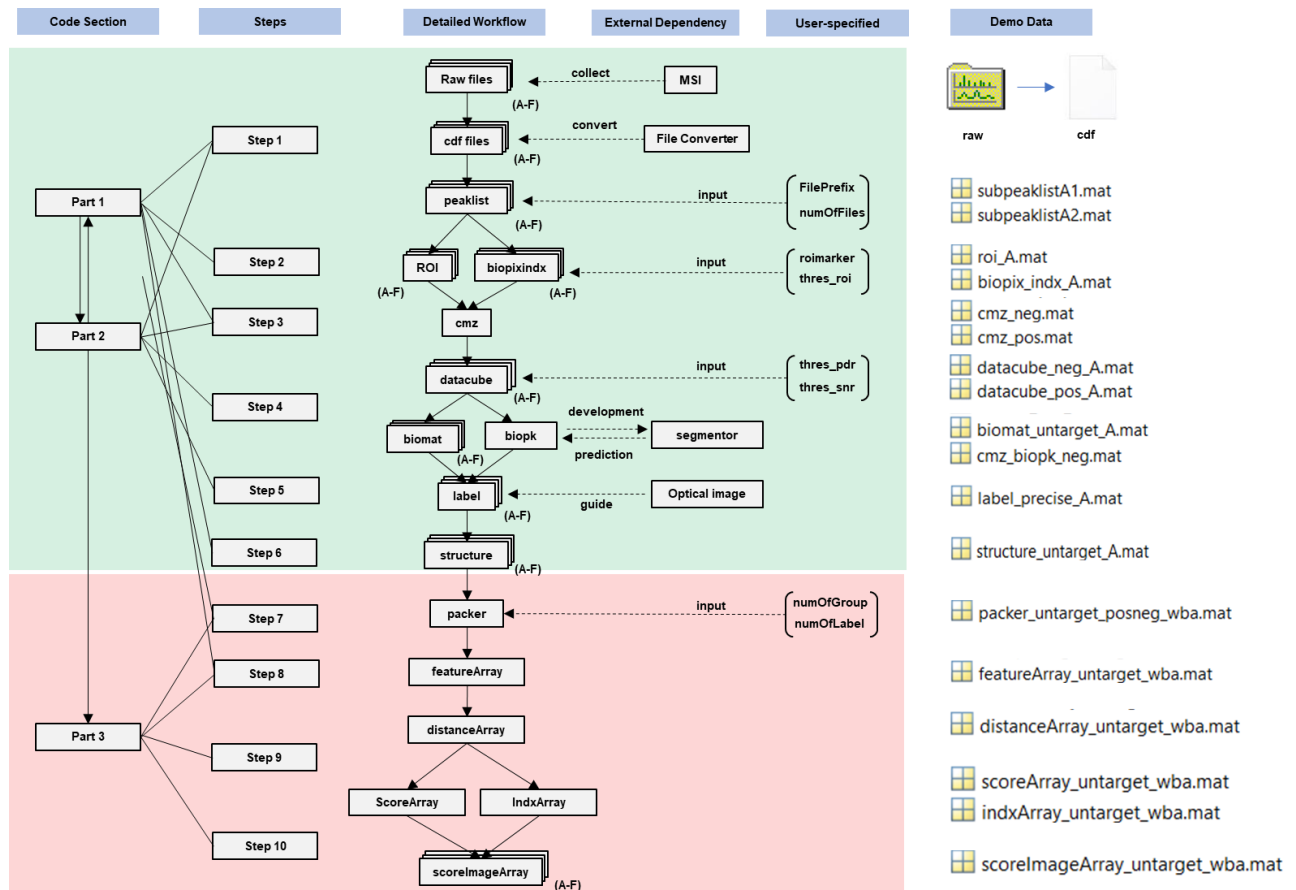

1. Background introduction of the demo data

- There were 7 whole-body animal (WBA) cryosections scanned by the air-flow-assisted desorption electrospray ionization mass spectrometry imaging method (AFADESI-MSI) under an ALTERNATIVE switching mode.
- The alternative scan was composed of three channels:
- Channel 1: m/z 50-1000 (negative)
- Channel 2: m/z 50-1000 (positive)
- Channel 3: t-SIM scan specific to drug ion: PTX, 876.3203 [M+Na]⁺; PTR, 983.4172 [M+H]⁺; PTS, 1039.4440 [M+H]⁺
- Tumor cryosections were scanned by AFADESI-MSI SEPARATELY from the WBA sample for the purpose of gaining more detailed metabolic profile information.
- The 7 WBA samples were coded from A to G: (A) healthy control; (B) xenograft tumor (negative treatment); (C) paclitaxel (PTX); (D) paclitaxel derivative 1 (PTR); and (E) low, (F) medium, (G) high dosage of paclitaxel derivative 2 (PTS).

2. General MSI^(x) Strategy and its application in preclinical drug research and development.

3. More detailed pipeline for MSI^(X) analysis

Step 1: Import CDF Files and save as a peaklist

Step 2: Delineate the Region of Interest and Register Pixel Index

Step 3: Generate the common peaks vector and construct a datacube

Step 4: Reduce the datacube volume size by SNR and PDR criteria

Step 5: Convert a datacube to a biomatrix

Step 6: Spatial Segmentation for WBA /tumor

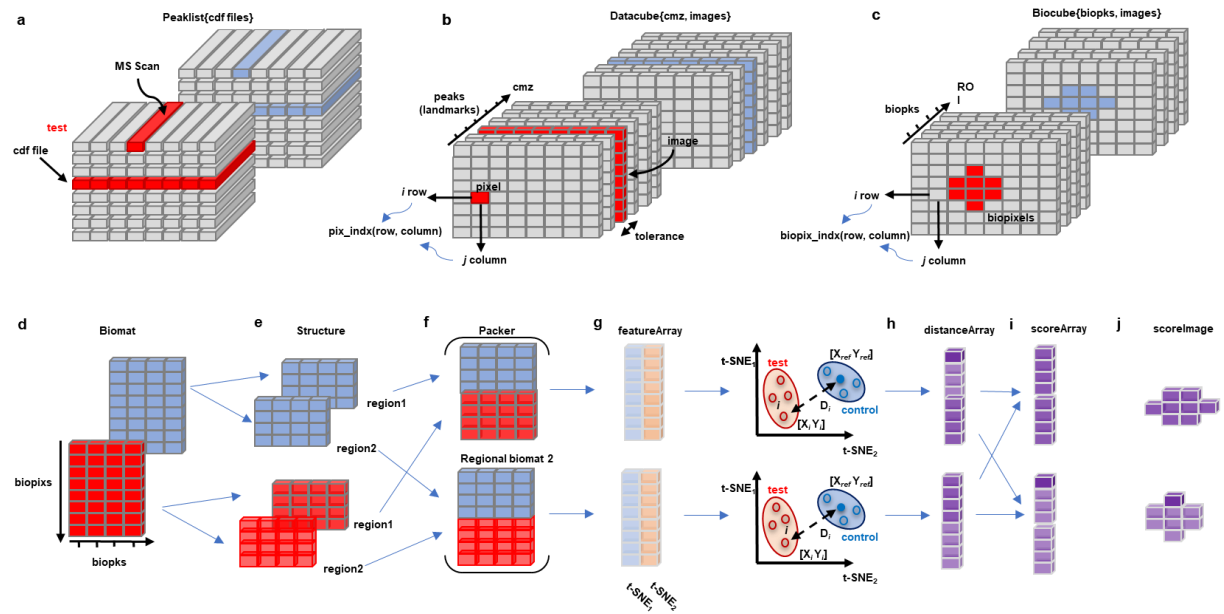

Step 7: Biomatrix splitting and regional biomatrix recombination

Step 8: Regional Metabolomic Feature Extraction

Step 9: Measure the General Perturbation for untargeted metabolomics or each pathway

Step 10: Construct Metabolic Perturbation Image for WBA/tumor

4. Diagram of Data Structure used in MSI^(X)

5. Pathway of source codes and correspondent demo Data

MATLAB R2021a - academic use **Part 1 pathway**

7. Nomenclature of variables

Folder/Pathway	Variable name	Description
D:\MATLAB\Data\MSI(x)\Part1	biopk_indx_neg	indexes of selected 1347 among the 3552 negative ions
	biopk_indx_pos	indexes of selected 1083 among the 5370 positive ions;
	cmz_biopk_neg	selected 1347 negative ions
	cmz_biopk_pos	selected 1083 positive ions
	cmz_dict_neg	498 negative ions included in the dictionary
	cmz_dict_pos	1317 positive ions included in the dictionary
	cmz_neg	3552 negative ions from average mass spectrum of WBA sample
	cmz_pos	5370 positive ions from average mass spectrum of WBA sample
	pdr_stata_neg	Summary of Positive detection rate (PDR) of 3552 negative ions among 7 WBA groups
	pdr_stata_pos	Summary of Positive detection rate (PDR) of 5370 positive ions among 7 WBA groups
	roimark_neg	Negative marker ions for ROI delineation
	snr_stata_neg	Summary of signal-to-noise ratio (SNR) of 3552 negative ions among 7 WBA groups
	snr_stata_pos	Summary of signal-to-noise ratio (SNR) of 5370 positive ions among 7 WBA groups
	dictionary_pos	dictionary that only includes 1317 positive ions and their corresponding pathway, function, species, and biotransformation
	dictionary_neg	dictionary that only includes 498 negative ions and their corresponding pathway, function, species, and biotransformation
	dictionary_posneg	dictionary that includes all 1815 ions and their corresponding pathway, function, species, and biotransformation
D:\MATLAB\Data\MSI(x)\Part2\tumor\B_tumor	peaklist_neg_B	all negative MS scans acquired from the group B tumor sample
	peaklist_pos_B	all positive MS scans acquired from the group B tumor sample
	roi_pos_B	Region of interest (ROI) delineated by the sum of positive marker ion intensities
	roi_neg_B	See above
	biopix_indx_neg_B	Row and column index of pixels within the delineated ROI of group B tumor
	biopix_indx_pos_B	See above

D:\MATLAB\Data\MSI(x)\Part2\tumor\C_tumor	label_precise_neg_B	Physiological region of pixels predicted by a pretrain machine learning model
	label_precise_pos_B	See above
	subpeaklist1_pos_C	First half of positive MS scans acquired from the group C tumor sample
	subpeaklist2_pos_C	Second half of positive MS scans acquired from the group C tumor sample
